LMM Stage Multitrack — User Manual

Version 1.0.7 · 10 November 2026 · Author: Lorenzo Miranda

LMM Stage Multitrack is the suite for playing live with multitracks: backing track, backing vocals, click and cues on separate outputs, section markers, lyrics on a second screen, voice cues and a click that follows the recording's real tempo. This manual describes exactly what version 1.0.7 does. If this is your first time, start with the **quick start guide** (Help menu).

1. Installation and start-up

1.1 The Mac app

1. Requirements: macOS 11 or later (Apple Silicon or Intel).
2. Install it from the **Mac App Store** or, if you received the `.dmg` file, open it and drag **LMM Stage Multitrack** to Applications.
3. Everything works **offline**: the app does not use the internet, creates no accounts and sends no data. The setlist and the audio are stored on your Mac.
4. To take the show to another Mac use **SHOW → SAVE FULL SESSION** and, on the other one, **IMPORT FULL SESSION** (section 12).

1.2 Help inside the app

The **Help** menu in the menu bar downloads, as PDF, the **quick start guide** (two pages to get going) and this **manual**, in English and in Spanish. The menu follows the interface language.

1.3 First start

The first time, three demo songs with synthetic audio appear (tagged DEMO). They let you try GO, Show Mode and the outputs without loading anything. **Restore demo** (under SHOW) goes back to that state and deletes the setlist

and all stored audio: it asks for confirmation.

1.4 Web version (browser)

The same application can be used in a browser. The differences depend on the browser:

	Mac app · Chrome / Edge	**Safari**
Choose the output interface from the app	Yes	No: the system output is used (Settings › Sound)
Real multichannel (outputs 3, 4, 5…)	Yes	Depends on the device; test it
MIDI pedal	Yes	No: use a USB keyboard-type pedal
Audio with the window in the background	Yes	May be suspended: keep the tab visible

The OUTPUTS dialog shows these capabilities. In the browser, data is stored per web address: the Mac app and the browser have separate stores, and you move from one to the other with the full session (section 12).

1.5 Language

The first time, the app opens in the Mac's language: Spanish if the system is in Spanish, English otherwise. **ES/EN** button in the Prepare header and in the Show top bar: it changes every text of the interface and the menu; it is remembered between sessions. It does not change user data (titles, marker names, lyrics) or the cue voice, which is in Spanish (see 7.4).

2. The two modes: Prepare and Show

- **PREPARE**: everything editable. Setlist on the left; on the right the current song with clock, timeline with markers, bar 1 and click controls, MIXER / LYRICS AND MARKERS tabs and the transport.
- **SHOW** (SHOW MODE button): black performance screen, no editing: title, current section, countdown to the next section, elapsed and remaining time, beat indicator, block timeline, quick mix, large transport, next song and setlist strip. **PREPARE** goes back. The mode is remembered on reload.

The Prepare header has: SHOW MODE, KEYBOARD (shortcuts and pedal), SHOW (session: name, export/import), OUTPUTS (interface and routing), STEREO / SPLIT L/R switch, full screen and language.

3. Setlist

- **Add**: name, BPM and key. The song is created with 240 s, INTRO / VERSE / CHORUS / OUTRO markers and a 1-bar count-in; then you load its tracks.
- **Selecting** a song prepares it (decodes its audio). ▲▼ reorder, ✏️ edits, 🗑️ deletes (asks for confirmation and removes its audio from the Mac if no other song uses it).
- List badges: NO AUDIO (no track with a file), DEMO, 🔗 "segue · N s" (see 8.1).
- **When the song ends**: AUTO-ADVANCE (chains all songs gaplessly) or STOP. Per-song segue overrides this setting.
- Everything is saved automatically and immediately on this Mac (there is no Save button).

4. Tracks and where they are stored

4.1 The four standard tracks and extras

Track	Content	Default output in Split L/R
CLICK	Click file **or** generated Magic Click	L · In-Ears
CUES	Recorded cues file + the app's voice cues	L · In-Ears
BASE (backing track)	Drums, bass, synths, sequences	R · PA
COROS (backing vocals)	Support vocals	R · PA
Extra track (N)	Anything else; **Extra track** button	PA (switchable)

Each MIXER card has: test tone on that channel (⚡), **load file** (⬆), name and file, OUTPUT, MUTE, SOLO, meter and fader in dB (double-click the value → 0 dB). Extras have ✕ to remove them.

4.2 Loading audio

- Formats: WAV, AIFF, MP3, M4A, FLAC, OGG, CAF (whatever the browser decodes).
- **File by file**: ⬆ on the track card.
- **Import folder**: pick a folder with the song's stems. Files are assigned by name: "click"/"metro" → CLICK; "cue"/"guía"/"voice"/"count" → CUES; "coro"/"vocal"/"harm"/"vox"/"bgv" → backing vocals; "base"/"inst"/"track"/"band"/"music"/"pista" → backing track; the rest become extra tracks named after the file. A `.txt` with "letra"/"lyric" in its name (or any `.txt` if there are few files) is loaded as lyrics.
- The song length is recomputed from the longest file. If a track differs by more than 1.5 s from the others, the card warns ("⚠ lasts 2:34, the others 4:28"): usually a file from another song.

4.2.1 Downloading an audio file to edit it and load it again

- **⬇ on the track card** (shown only when the track has a file loaded) downloads that file **exactly as you loaded it**: same bytes and same name, with no re-encoding and without the fader, mute or SYNC offset applied. The Magic Click has no file, so it offers no download.
- The **original version** downloads the same way from Edit song (⬇ next to the file name).
- Workflow: ⬇ download → edit in your audio editor (EQ, clean-up, normalise) → ⬆ load the edited file on the same track. The track keeps its volume, mute, solo and output.
- **Keep the same start point and length** when exporting from the editor: if you trim the beginning, the track no longer lines up with the click and the other tracks.
- Loading a new file discards the offset measured for the previous one: if the track was synced with the original version, press SYNC again (section 6.6).
- Downloading changes nothing in the session. The previous file is removed from the store only when you load the new one in its place.

4.3 Where the files live

When you load a file, **the app copies the file into its own store on this Mac** and plays from there from then on. The original folder can be moved or deleted. Therefore:

- If you change Mac (or browser, in the web version), that store is not there: tracks appear in red as MISSING and the app warns "Files not found on this Mac". Load them again or import a full session (section 12).

- **remove audio** on a card deletes the file from the store if no other track uses it. **Clean orphan audio** (under SHOW) deletes files no song references any more.
- The store has a generous quota (a share of the disk). Measured: 25 songs × 3 min × 4 WAV stems ≈ 1.5 GB without issues.
- The app keeps only the current and the next song decoded in memory.
- **Sync:** export the original version, the backing track and the choirs from the same session and the same start point. If a file comes from another start point, measure and fix it with SYNC (section 6.6).

4.4 Mute the file only

On CLICK and CUES, when a file is loaded, **MUTE FILE** appears: it mutes only that file for this song; the Magic Click and the voice cues keep playing on the same channel, with its fader and output. MUTE, instead, silences the whole channel.

5. Magic Click and bar 1

5.1 What it is

The **Magic Click** is a metronome generated by the app for the whole song: accent on beat 1 of every bar, a sound with a transient (audible in in-ears) and a tonal body, level close to 0 dBFS. Enable it with the MAGIC CLICK button on the CLICK card or with GENERATE CLICK.

5.2 Bar 1

Backing tracks rarely start exactly on beat 1 (leading silence, pickup). Each song has a **bar 1** (`BAR 1` under the timeline): the position in the audio where beat 1 of the first bar falls. Everything tempo-related aligns to it: the Magic Click, the bars ruler, the Show beat indicator and the count-in.

How to set it:

- Drag the **1** marker (cyan, at the bottom of the timeline); double-click jumps there.
- Type the seconds (with milliseconds) in the box, **Set here** (playhead position), or fine-tune with **–1 ♩ / –10 ms / +10 ms / +1 ♩**.
- **Detect in BACKING** (only if the song has no reference): finds the first attack of the backing track. If the track enters on a pickup, the first attack is not the 1: correct with ±1 ♩.
- With an original version loaded, bar 1 comes from the reference analysis (section 6).

Recommended method: with the Magic Click on, play and adjust until the click lands exactly with the backing track. **LISTEN TO ORIGINAL** (6.5) helps.

5.3 GENERATE CLICK and pitch

Moving bar 1 or changing the **Pitch** does not change the click that is playing: the click is built only when you press **GENERATE CLICK** (so the audio is not rebuilt on every move). While the settings differ from the generated click, the button pulses and "the click playing does not have these settings" appears. Pitch goes from Very low (–12 semitones) to Very high (+12) and also affects the count-in.

6. Reference track and analysis

6.1 What it is

The song's **original version** (same length as the backing track) is loaded under ✏️ **Edit song → Original version (reference)**. It does not play in the show: it is used to analyse the count-in, bar 1, the structure and the real tempo, and to build lyrics and cues. It is stored in the same store as the tracks. If it differs from the backing track by more than 0.5 s, a warning appears.

6.2 Detect count-in, bar 1 and structure

A single button. The analysis returns, and the dialog shows for review:

- **BPM and key** (e.g. "131 BPM · E Major"). If the tempo is doubtful the previous one is kept. The beat map arbitrates between the estimated tempo and its relatives (×2, ÷2, ×1.5, ÷1.5): a shuffle at 96 BPM is estimated at 144 and the map corrects it, because at 96 almost every beat lands on a clear attack and at 144 it does not; a ballad whose eighth notes are estimated at 130 goes back to 65 because in the 130 map every other beat has no attack. If every beat of the map really sounds, it does not halve even when half tempo looks more reliable.
- **Count-in**: stick hits or a spoken count before the entry. Rule: the hits occupy beats 1..B and **the song enters on beat B+1**. With "1, 2, 3" the song enters on **4** and bar 1 falls one beat after the entry; with "1, 2, 3, 4" it enters on 1. The **COUNT-IN AND BAR 1** editor lets you correct beats counted, "enters on beat" and entry in seconds; the resulting bar 1 is shown live. If the file has a count-in, the app's count-in is set to 0. **A single hit** before the entry (the drummer's snare on "4", as in Hold the Line) is taken as the 4: the song enters on 1 right after. The entry is the first sustained stretch of music measured against the noise floor, so a soft intro (solo piano 20 dB below the band) counts as the song, while a lone hit with a reverb tail does not. The editor shows which beat each hit is ("0.19 s = 4"). If the file brings part of the count (only the 4) and you want the full count, leave the app count-in at 1 bar (the app's "4" coincides with the file's hit) or at 2 bars to count 8 beats. Below the resulting bar 1 the **drum check** appears: "✓ snare on 2 and 4" when bar 1 matches the kick/snare pattern, or a warning if the snare would fall on 1 and 3 (bar 1 one beat off: change "Enters on beat" by one beat). It updates live with every change.
- **REAL TEMPO (tempo map)**: the time of every beat of the recording (beat tracker). It shows min–max range, median, number of beats and reliability. With **Follow the original's real tempo** ticked (default when reliability ≥ 40 %), the BPM becomes the median, bar 1 snaps to the nearest map beat and **the click, the bars ruler, the beat indicator and the count-in follow the map** instead of a fixed tempo. A human recording varies ±2 BPM and a fixed click drifts half a second in a few minutes; with the map the click lands within milliseconds of the attacks. Badge "REAL TEMPO · N beats" on the panel and "bar · real tempo" on the ruler.
- **STRUCTURE**: proposed sections INTRO / VERSE n / PRE-CHORUS / CHORUS n / SOLO (or BRIDGE) / ENDING, by real bars. It is an estimate: edit time and name, add or remove rows, or load **Current markers** to tweak them.

6.3 On save

- **Replace the markers** replaces the song's sections with the list (voice cue by name; COUNT at 0 s if the file has a count-in).
- **Create the lyrics template** writes one `[SECTION]` tag per marker if the lyrics were empty.
- Bar 1 and the map are applied. Then press **GENERATE CLICK** (the notice reminds you).

6.4 Estimate BPM and key from the backing track

Only without a reference (with a reference loaded its analysis already gives BPM and key, and the button is hidden), **Estimate BPM and key from the BACKING TRACK (file)** analyses that song's backing track (decoding it if needed) and proposes a BPM with high/medium/low reliability and a key (Krumhansl-Kessler profiles). It is a suggestion: review it.

6.5 Listen to original

LISTEN TO ORIGINAL (under the timeline, with its own volume) plays the reference in sync with the song through the CLICK output (in-ears in Split/Multichannel), bypassing the click fader. Use it to check that click and original line up. It switches off when entering Show and never plays there.

6.6 SYNC the files with the original

The click and the cues are generated from the **reference** grid, so they are already locked to it. The only thing that can drift are the **files** (BACKING, CHOIRS and, if loaded as files, CLICK and CUES). The golden rule: **export the original version, the backing track and the choirs from the same DAW session and the same start point** (hence the same length). Same duration does not guarantee the same start (a 10 ms different head already shifts everything), which is why the app can measure it:

- In **Edit song → SYNC WITH THE ORIGINAL**, the **SYNC** button measures each file's offset against the reference by correlating the waveform itself (30 s window, ±5 s search, tenths of a millisecond precision) and, as a cross-check, the attack envelopes. Per file it shows `offset X ms · confidence Y %`.
- **Reliable** → the offset is filled in automatically. **Unreliable** (another take, another tempo, a mix without attacks) → not applied and the reason is shown; check the file.
- **−10 / −1 / +1 / +10 ms** buttons and a ms field to fine-tune by ear with **LISTEN TO ORIGINAL**. Positive = the file is late and is read ahead; negative = it starts later.
- The graph overlays the first 8 s of attacks of the original (purple) and of the already shifted file (cyan): when they match, the curves coincide.
- On **Save**, the offsets apply to playback. An offset of 0 changes nothing: it is the usual behaviour.
- **Shortcut in the mixer:** every card with a file shows a **SYNC** button until that track has been measured against the current reference. It measures only that track and, if reliable, saves the offset directly (notice `BACKING synced with the original: offset X ms applied`); the card then shows `✓ synced · X ms` and the button disappears. If the measurement is unreliable, nothing is applied and it says so. Loading another file into the track clears the offset and offers the button again.
- Syncing does **not** change the click: the click is generated from the reference grid and the sync only moves the file. No need to GENERATE CLICK again.

7. Markers, lyrics and voice cues

7.1 Markers

Each song has markers (sections) with a name and a time. On the timeline: **MARK HERE** (playhead position; opens a dialog with quick names INTRO, VERSE 1, CHORUS…), drag to move, double-click to jump. Under LYRICS AND MARKERS: an editable list (name, seconds, cue, ▶ listen to the cue, Go, Set here, delete), **+ Add here** and ⇆ **Shift all** (moves all markers and bar 1 by N seconds; negative = earlier; this is what you do after trimming the count-in from an already marked backing track). Duplicate names are allowed. Marker names are your data: they are not translated.

Bars ruler above the timeline: minutes:seconds and bars from bar 1 (theoretical with a fixed tempo, "bar ≈", or real with a map). Zoom 1×–32× with the buttons or Ctrl/Cmd + wheel; while playing, the view follows the playhead.

7.2 Lyrics

LYRICS AND MARKERS tab: paste the lyrics with `[VERSE 1]`, `[CHORUS]`… tags using the same names as the markers. The active tag lights up in Show and on the 2nd screen when the marker is reached. The +[SECTION] buttons insert the tag.

Automated lyrics editor. In the LYRICS WITH TAGS panel:

- **Import TXT** loads the lyrics from a plain text file (UTF-8, UTF-16 or Latin-1). You can also **paste** them into the box. On import, recognised headings are rewritten as `[TAG]`: `[Verse 1]`, `[Chorus: artist]`, `Coro:`, `(Bridge)`, `**Pre-Chorus**` or the bare word at the start of a block (`Verse 2`). Spanish and English are recognised: intro, verse/verso/estrofa, pre-chorus/pre-coro, chorus/coro/estribillo/hook, post-chorus, bridge/puente, solo, interlude/instrumental, break/pausa, outro/final/coda. A bare word in the middle of a stanza stays as lyrics.
- **IMPORT TAGS TO MARKERS** sends the lyric tags to the cue track. It first shows the plan without changing anything: each tag with its time and what will happen. Tags are paired with the existing markers by type and order (CHORUS with CORO, VERSE 1 with VERSO 1): paired markers **keep their time** and take the tag's name (the voice cue is deduced again from the new name). Unpaired tags are added as new markers at an **estimated position**, spread across the gap between their neighbours. No marker is deleted: those not in the lyrics (COUNT, an instrumental SOLO, a custom name) are kept. Two identical tags with different text are numbered (VERSE 1, VERSE 2) so the 2nd screen shows the right one.
- After applying, the notice **ADJUST THE POSITION OF THE TAGS IN THE SONG** appears and each new marker carries an **ADJUST** badge: play the song and press **Set here** on reaching each section, or drag the marker on the timeline. Repeating the import never duplicates anything.

Sharing lyrics and markers: the `.lmm` file. In the LYRICS AND MARKERS header:

- **Export .LMM** saves the selected song's lyrics and markers to a text file `Title – Artist.lmm`. It carries no audio, mix or routing: it is a few KB and can be sent by email or chat.
- **Import .LMM** loads a `.lmm` file into the selected song. It asks for confirmation first and warns if the file was made with audio of a different length, at another tempo, or if any marker falls after the end. On accepting it **replaces** the lyrics and the markers (with their voice cue); title, tempo, key, audio and mix do not change. A file with lyrics only keeps your markers.
- Marker times are those of the exporter's audio. If your backing track has a different count-in or arrangement, use ⇆ **Shift all** or **Set here** to place them.

The file is plain UTF-8 text and can be opened and fixed in any editor:

```
LMM-STAGE-MULTITRACK-SONG 1
title: Title
artist: Artist
bpm: 120
time: 4/4
key: C Major
duration: 240
bar1: 0

=== MARKERS ===
0 | INTRO | none
8 | VERSE 1 | count
20 | CHORUS | coro

=== LYRICS ===
[INTRO]

[VERSE 1]
…
```

Each marker is `seconds | name | cue` (the cue is optional: `entra`, `coro`, `solo`, `pausa`, `final`, `ultima_vuelta`, `count`, `none`). Everything after `=== LYRICS ===` is the lyrics. A file created with a newer format than your app's is rejected with a notice to update.

7.3 Voice cues

Each marker can carry a **recorded voice cue** that plays before it on the CUES channel (with its fader, mute, solo and output): the phrase ("Chorus on…", "Solo on…", "Break on…", "Ending on…", "Enter on…") and then "one two three four" falling on the beats of the bar before the marker, at the song's tempo (in 3/4, "one two three"). "Last time" is spoken on reaching the marker, without a count. Options: Enter / Chorus / Solo / Break / Ending on 1 2 3 4, Last time, Count only, No cue.

When a marker is created or renamed the cue is chosen from the name (CORO/CHORUS → chorus; SOLO → solo; OUTRO/FINAL/CODA/END → ending; PAUSA/BREAK → break; INTRO/START → enter; ÚLTIMA → last time; PRE-CHORUS/BRIDGE and the rest → count only). A marker less than one bar from the start gets no cue (the count-in is already there). **EDIT CUES** (CUES card) shows them all with the time they start and a button to hear them at tempo. Besides the voice you can load a complete cues file on the CUES channel; both play together.

7.4 Voice language

The recorded voice (file `cues/voz-es.mp3`) **is Spanish only**, also with the interface in English. An English voice (`voz-en.mp3`) is planned for a later version: the app already reserves the `cuesLang` field in the session.

8. Segue, chaining and count-in

8.1 Segue songs

✏️ Edit song → **Segues into the next song** and **Pause before the next song's count** (0–30 s). When it ends, the next one starts by itself after that pause, even if the global setting is STOP. During the pause the transport keeps

running and Prepare and Show show "starts in N s". Pause or STOP cancel the segue. 🔗 indicator in the setlist and "segue · N s" next to NEXT.

8.2 AUTO-ADVANCE (gapless chaining)

With AUTO-ADVANCE, the next song is decoded and scheduled on the audio clock to start exactly when the current one ends ("chained" badge). If there is no time to prepare it, the app starts it itself at the end.

8.3 Count-in generated by the app

Recommended workflow: trim the backing tracks so they start on beat 1 and let the app generate the count-in. ✏️ Edit song → **Count-in**: 0 (the backing track has its own), 1 or 2 bars. The count-in plays **before 0 s, through CLICK and CUES only** (in-ears): bars of Magic Click at the song's tempo and pitch plus the voice "Enter on one two three four" in the last bar. The PA receives nothing because backing track and vocals have not started yet.

- It plays on GO from 0 s, when jumping to a song with GO (Enter, click on NEXT) and when the song arrives by segue or chaining (after the pause). It does not play when resuming from pause or after seeking.
- **It is anchored to bar 1** of the generated click: the "four" and the first hit of the music are exactly one beat apart. If bar 1 falls late in the file, part of the count-in plays while the file is already running (its leading silence).
- With a tempo map, the count-in uses the local tempo at bar 1.
- During the count-in the clock shows 0 and "starts in N s" appears.

9. Outputs: stereo, Split L/R, multichannel and in-ears

9.1 Modes

Mode	What it does	When
STEREO	All tracks centred	Rehearsing with headphones
SPLIT L/R	L (output 1) = in-ears: click, cues and tracks marked EARS. R (output 2) = PA: backing, vocals and tracks marked PA. Each track is collapsed to mono per side with level compensation.	Stereo interface + one cable to PA and one to in-ears
MULTICHANNEL	Each track to the physical outputs you choose: stereo pair (1-2, 3-4…), mono (5, 6…) or double send (1-2+5).	Interface with 4+ outputs (Tascam, etc.)

The STEREO / SPLIT L/R switch is in the header; MULTICHANNEL is chosen under **OUTPUTS**. In Split, the OUTPUT button on each card toggles EARS/PA.

9.2 OUTPUTS dialog

1. **Output device** (Chromium only): choose the interface; **Refresh** asks for the names. In Safari, select the interface in Settings › Sound.
2. **Output mode**.
3. **Physical output assignment** per track, from the list of detected outputs (minimum 8). If an output does not exist on the current device it is marked "unavailable" and that track plays through 1-2 (amber warning also on the mixer and the routing summary).

4. **Test tone** overall; ⚡ on each card tests that channel through its output.

9.3 Levels and meters

Faders in dB with a logarithmic law: 1.00 = +6 dB, 0.80 = 0 dB, 0.40 = −12 dB, 0 = −∞. RMS meters with 1 s peak hold, 2 s clip indicator and ticks at −6/−12/−24/−40. Master with mute. In Show there is a collapsible **quick mix** row (large MUTE per track, horizontal fader and meter).

9.4 Fades

Every source starts and stops with 3–8 ms fades (seek, pause, STOP, end of file, song change) and voice clips with 20 ms: no clicks or pops. That includes the generated click, the cues and the count-in, which go through the same stop envelope as the files. Panic (Esc) fades out in 250 ms and silences, and the level comes back as a ramp only once everything is already silent. Changing the routing or the outputs while audio plays dips the master to zero for a few milliseconds, reconnects and comes back: nothing is ever disconnected with signal flowing. The generated click has a level ceiling (two overlapping hits cannot clip). Engine rule: only what is in the files reaches the output; an automated test watches the output with a pure tone through every transport move and fails on any step that is not in the audio.

10. Keyboard shortcuts, pedal and MIDI

KEYBOARD dialog (Prepare header or the icon in Show). Each action accepts several keys; assigning a key removes it from whichever action had it; **Reset** restores the defaults.

Action	Default
GO / pause	Space
Next song and GO	Enter, Enter (num)
Next / previous song	→ / ← and Page ↓ / Page ↑ (page-turner pedals)
Panic (fade and silence)	Esc
Stop and return to start	(unassigned)
Mute / unmute click	M
Show / hide lyrics (Show)	L
Full screen	F
Jump to section 1–9	1–9

Options: **In Show, GO never pauses** (on by default: the key only starts; use the button to pause) and **STOP requires press and hold** (600 ms with a progress ring; a short click shows "PRESS AND HOLD").

- **USB pedals** (AirTurn, PageFlip, Donner…) appear as a keyboard: press **Assign** and step on the pedal.
- **MIDI pedals** (Chromium only): **MIDI** button per action; notes and controllers (rising edge) trigger the action. The MIDI permission is only requested when there is an assignment.
- Shortcuts are ignored while typing in a text field. Esc inside a dialog closes it without triggering panic.

11. Second screen and projection

2ND SCREEN (LYRICS AND MARKERS, or the monitor icon in Show) opens a black window: title, active section, "NEXT:", lyrics by section (the active one highlighted and centred), time and remaining. Drag it to the band's or audience's display and make it full screen. It updates only when something visible changes, with a 250 ms safety heartbeat, without flicker. **A- / A+** change the text size (50–200 %). The **preview** inside LYRICS AND MARKERS is the same document at 1280×720, live. In the web version, if the browser blocks the window, allow pop-ups for the site.

12. Export and import the session

12.0 Printable set list (Word)

In **SHOW → Session and show**, the **PRINTABLE SET LIST (Word)** button downloads a `.docx` with the set list on a single page (8.5 × 14", large type): a title with the date and the show name, and a table with number, song, key, BPM, duration and notes (segue into next, pause, count-in). The font size only shrinks when there are many songs so it still fits one page. Open it in Word or Pages, tweak what you want and print one copy per musician.

SHOW dialog (header button):

- **Show name**.
- **SAVE FULL SESSION**: creates a portable folder `LMM Show – <name> – <date>/` with:
  - `show.json`: the complete setlist (songs, markers, lyrics, cues, mix, routing, bar 1, tempo map, reference, segues, count-in) plus the list of audio files with their ids.
  - `audio/01 Song/base/…`, `coros/…`, `click/…` (only if it is a file; the Magic Click is regenerated), `cues/…`, `extra/…`, `referencia/…` (the original version): one file per track, with its **original name**.
  - `README.txt` with instructions. In Chrome/Edge it asks for the destination folder (File System Access); in Safari, or when a folder cannot be chosen, it downloads a **ZIP** with the same content. **Download as ZIP** forces the ZIP. While it works, a **progress bar** in the same dialog shows the phase (reading the app's audio, packing the ZIP with a byte percentage, writing to the folder) and the buttons stay disabled. The ZIP is assembled without loading whole audio files into memory: a 1.2 GB show packs in seconds and the download starts when the percentage completes. In Chrome, Edge and the desktop app the ZIP is first written to the browser's private storage and downloaded from there; that temporary file takes the same space as the ZIP for a few minutes and is removed automatically.
- **IMPORT FULL SESSION**: pick that folder (or **Import from ZIP** the .zip). It asks for confirmation, replaces the current setlist, copies the audio into the store **with the same ids** (so each track finds its file) and removes from the Mac the audio of the previous songs that the imported session does not use. Files missing from the folder appear in red (MISSING). Designed to move the show via local Dropbox or a drive between computers, and to migrate from the browser to the desktop app. The progress bar shows "Locating files" and then "Saving audio into the app n/m" with the percentage; a 1.2 GB ZIP imports in about 10 s (before, the tab stayed "loading" for minutes and ran out of memory).
- **Export setlist (.json)** / **Import setlist (.json)**: metadata only, no audio (compatible with earlier sessions). Importing a .json on a Mac without the audio marks the tracks MISSING.
- **Restore demo** and **Clean orphan audio** (see 1.3 and 4.3).

12.9 Plans and purchases (Mac App Store version only)

In the Mac App Store app, the Prepare header shows a crown badge: **FREE n/3** or **PRO**. Free mode includes the demo songs and up to **3 of your own songs** with every feature; trying to add or import more opens the plans screen. Clicking the badge opens it too.

- **Pro subscription**: monthly, 6-month or yearly, with a free trial for the first days. It renews automatically; cancel it from **Manage subscription** (your App Store account settings) at least 24 h before the period ends.
- **Lifetime licence**: one-time payment, no renewals, all future updates included.
- **Restore purchases**: if you change Mac or reinstall, press this button with the same App Store account.

Nothing is ever blocked in SHOW mode: if the subscription expires in the middle of a gig, the show goes on and the notice appears afterwards. The web version and the directly distributed app (DMG) have no store and no limit.

13. Troubleshooting

Symptom	Cause and fix
"Audio on hold" / no sound	The browser requires a click: press **ENABLE AUDIO** (or GO).
"Audio suspended by the system"	The interface was disconnected or the system suspended audio: check the interface and press **RESUME AUDIO**. In Safari, keep the tab visible.
Tracks in red, "Files not found on this Mac"	The app's store does not have those files (another Mac, another browser, or cleared data). Load them again or import the full session.
RELOAD: file	Track saved with an old version that did not copy the audio: load it again.
The setlist "disappeared"	The Mac app and the browser store data separately: open the one you used to prepare the show. To move from one to the other use the full session (section 12).
The click runs ahead of or behind the music	1) Adjust bar 1 and press GENERATE CLICK. 2) If the offset grows over time, the recording has no fixed tempo: load the original version and enable the real tempo (tempo map).
The click is "crossed": it matches one beat and misses the next ones, and moving bar 1 does not fix it	The map's tempo is a false relative of the real one (e.g. 86 BPM on a 65 BPM song). Open the original version and ANALYZE again: the current tempo arbiter rejects those relatives. Check that the BPM shown is the one the band counts.
A loud click or crackle that is not in the files	Since 1.0.3 the engine never cuts or reconnects anything abruptly (pause, stop, seek, song change, panic, routing change) and uses a ~20 ms output buffer. If you still hear it: 1) check whether the meter shows CLIP (faders above 0 dB summing full-scale tracks: lower the faders); 2) check the Mac's audio output and sample rate (Audio MIDI Setup) and avoid Bluetooth outputs in the show.
"the click playing does not have these settings"	Press GENERATE CLICK.
The count is heard twice	A marker near 0 s with a count cue: set its cue to "No cue" or move it later; the app already drops cues starting before 0 s when starting from the beginning.
Gap between the "four" and the entry	The count-in is anchored to the generated click's bar 1: check bar 1 and regenerate the click.
A track plays through 1-2 in multichannel	The assigned output does not exist on the current device ("unavailable"): pick the right interface or reassign.
Cannot choose the Tascam under OUTPUTS	Safari does not allow it: select it as the system output or use Chrome.
The MIDI pedal does not respond	Chromium only; assign an action with MIDI first so the permission is requested. In Safari use a keyboard-type USB pedal.
The projection window does not open	Allow pop-ups for the site.

Symptom	Cause and fix
Mix louder or quieter than before	The fader law is logarithmic (0.80 = 0 dB, 1.00 = +6 dB). Double-click the value to return to 0 dB.
The app does not update / "A new version is available"	Installed (PWA) version only. Press Update outside Show; it never reloads by itself.
